SIL765: Networks and System Security

Assignment – 4

1) There are 27 different message identifiers which are recorded on this CAN bus, these are

```
['0316', '018f', '0260', '02a0', '0329', '0545', '0002', '0153', '02c0', '0130', '0131', '0140', '0350', '043f', '0370', '0440', '04f0', '0430', '04b1', '01f1', '05f0', '00a0', '00a1', '0690', '05a0', '05a2', '0000']

(base) Nikitas-MacBook-Air:SIL_Assign4 nikitabhamu$ python can.py Different message identifiers : 27
['0316', '018f', '0260', '02a0', '0329', '0545', '0002', '0153', '02c0', '0130', '0131', '0140', '0350', '043f', '0370', '0440', '04f0', '0430', '04b1', '01f1', '05f0', '00a0', '00a1', '0690', '05a0', '05a2', '0000']
```

2) All the messages are read till the time the first anomaly shows up, i.e., the time when the first message with label with 'T' comes up.

We found that mean of the inter message arrival times of the some message ids is 10 times the standard deviation, rest all the message ids have standard deviation quite less than the mean. So, if we consider a message to be periodic if the standard deviation of the inter message arrival times if 10 or more times lesser than the mean of the inter message arrival time, then all the messages will turn out to be periodic

DoS dataset:

| DOS_datase | ι. | | | |

3) IDS for DOS attacks:

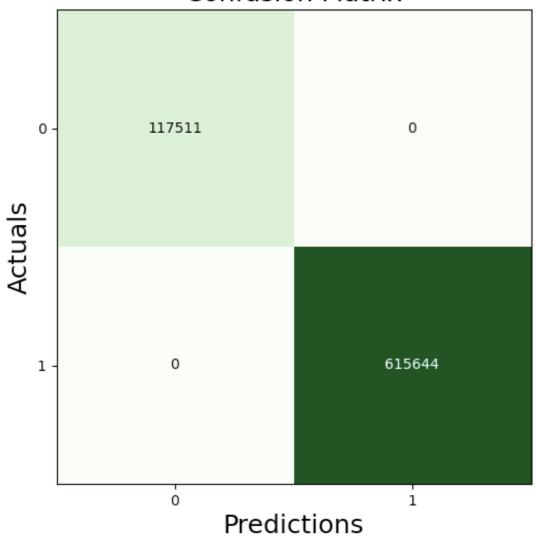

How to execute?

- --> python ids_dos.py DoS_dataset.csv
- -> Classifier used :- Logistic Regression
- --> Features of the message used :
 - 1. Message identifier
 - 2. Data length
 - 3. Inter message arrival time

This model is trained on 80% of the dataset given and tested on 20% of the dataset The accuracy which this model is giving is : 100%

| | precision | recall | f1-score | support | | |
|-------------|-----------|--------|----------|---------|--|--|
| 0 | 1.00 | 1.00 | 1.00 | 117511 | | |
| 1 | 1.00 | 1.00 | 1.00 | 615644 | | |

Confusion Matrix

'R' labeled messages correctly identified: 615644

'R' labeled messages wrongly identified: 0

'T' labeled messages correctly identified: 117511

'T' labeled messages wrongly identified: 0

Detection rate of this model: 100%

False alarm rate: 0%

4) IDS for Impersonation attacks :

How to execute?

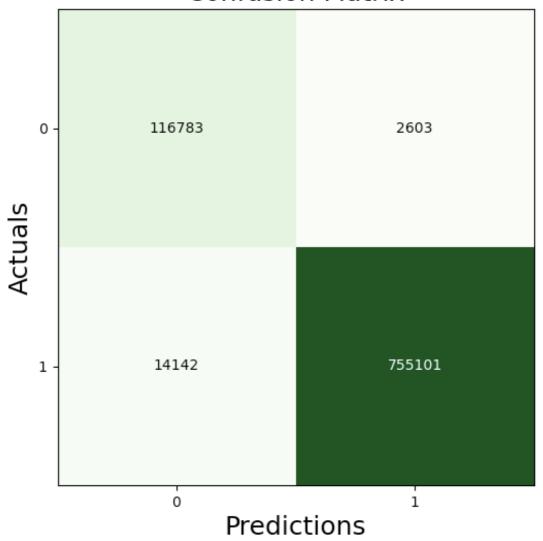

- --> python ids_dos.py DoS_dataset.csv
- -> Classifier used :- Logistic Regression
- --> Features of the message used :
 - 1. Message identifier
 - 2. Data length

- 3. Mean of the inter message arrival times
- 4. Standard deviation of the inter message arrival times
- 5. Inter message arrival time

This model is trained on 80% of the dataset given and tested on 20% of the dataset The accuracy which this model is giving is: 98.115%

| Accuracy : | 0. | 98115636559 | 23901 | | | |
|-------------|----|-------------|--------|----------|---------|--|
